

Control Structures

When a macro is called, all its steps are executed sequentially.

However, you can define conditional steps - steps which are only executed if a condition is met. In order to do this, simply give the step a condition property, like in [Chase - Double speed](#):

```
<step condition="Math.IsEqual(Playbacks.Editor.Times.ChaseSpeed, 0.0)">
  ActionScript.SetProperty.Float("Playbacks.Editor.Times.ChaseSpeed", 1.0)
</step>
```

At the moment (version 10.0 and 10.1) it looks like such conditions are stripped when a macro is copied in Titan. Hence, always move macros with conditions (which has the drawback that you can have a macro only on one handle.

This step is only executed if its condition is met - and the condition is a function written in double quotes: [Math.IsEqual](#) takes two values as arguments and returns true if both values are equal. In total, if the property `Playbacks.Editor.Times.ChaseSpeed` equals 0.0 then this step is performed and sets this property to 1.0.

Another mechanism is also related to control structures albeit strictly it is just juggling with booleans: simple toggle logic, see [Timecode - Enable/Disable](#):

```
<step>ActionScript.SetProperty.Boolean("Timecode.Enabled",
!Timecode.Enabled)</step>
```

This simply negates a variable, effectively turning it into its reciprocal value: if the variable 'Timecode.Enabled' is true it will be set to false, and vice versa.

There are also some other syntax versions:

```
<step>
{
  if(Math.IsNotEqual(Playbacks.Editor.Times.ChaseSpeed, 0.0)) {
    ** Do Something **
  } else {
    ActionScript.SetProperty.Float("Playbacks.Editor.Times.ChaseSpeed",
1.0);
  }
}
</step>
```

and as of version 10, it is possible to write conditions in a more modern way:

```
<step>
{
  if(Playbacks.Editor.Times.ChaseSpeed == 0.0) {
    ActionScript.SetProperty.Float("Playbacks.Editor.Times.ChaseSpeed",
1.0);
  }
}
```

```
}  
}  
</step>
```
