

Function

# Playbacks.FilterByPlaybackHandle

```
IEnumerable<T> Playbacks.FilterByPlaybackHandle(IEnumerable<Handle> handles)
```

<b>API</b>	<a href="https://api.avolites.com/15.0/api/Playbacks.FilterByPlaybackHandle.html">https://api.avolites.com/15.0/api/Playbacks.FilterByPlaybackHandle.html</a>
<b>description</b>	Returns the same list but with only handles that derive from a playback handle.
<b>namespace</b>	Playbacks
<b>parameter</b>	handles ( <a href="#">IEnumerable</a> ) : The list of handles.
<b>return value</b>	<a href="#">IEnumerable</a>

## Example in

[Playback Groups - Create and Add:](#)

```
<step>PlaybackGroups.CreatePlaybackGroupWithPlaybacks("Test",  
Playbacks.FilterByPlaybackHandle(Handles.ContextHandles))</step>
```

Here the outer function `CreatePlaybackGroupWithPlaybacks()` lives in the namespace `PlaybackGroups` but requires the second parameter to be a list of Playback handles. `Playbacks.FilterByPlaybackHandle()` makes sure the passed list is looked up correctly.

## Also used in

- [Playback Groups - Create and Add](#)
- [PlaybackGroups.AddPlaybacksToGroup](#)
- [PlaybackGroups.CreatePlaybackGroupWithPlaybacks](#)
